

Builder.io Keyword Definitions

Quick reference guide for sales calls and prospect conversations

Products & Platform

Visual AI Development

Builder.io's approach to software creation that combines AI code generation with visual editing, enabling anyone in an organization to build and ship web experiences.

Fusion

Builder.io's code generation product that builds apps and UIs from scratch, from Figma designs, or with any existing repo. Supports web app development, prototypes, and design-to-code workflows.

Publish

Builder.io's headless CMS and page builder product. Create, optimize, and publish on-brand content and experiences to any site or app via API.

Projects

Builder.io's feature for connecting a Git repo (GitHub, Azure DevOps, Bitbucket) and using AI to generate and visually edit code with full codebase context.

Headless CMS

A content management system where the backend is decoupled from the frontend. Builder.io's visual headless CMS lets marketing teams edit content without developer involvement.

Design-to-Code

Builder.io's capability to convert Figma designs into clean, production-ready code in your chosen framework, generating semantic, accessible, reusable components.

Component Mapping

Linking Figma design components to their corresponding code components in your design system, so generated code uses your actual components with correct props and types.

Value Propositions

Iteration Velocity

The compounding benefit of shipping fast. More iteration cycles lead to faster learning, faster outcomes, and greater impact over time.

Faster Time-to-Market

Import from Figma, drag and drop existing components, and click to publish. Getting ideas to production in minutes instead of months.

Increased Productivity

Saving developers, designers, PMs, and marketers time and effort by reducing manual handoffs and eliminating redundant workflows.

Lower TCO

Reducing the total cost of ownership by cutting development costs and eliminating redundant tools across web and mobile experiences.

Visual Coding

A Figma-like visual editor that lets anyone refine UI details while maintaining full code output. Combines natural language prompting with point-and-click editing.

Pain Points & Positioning

Development Backlog

The \$1.6 trillion industry problem of bottlenecked development queues. Ideas, designs, and features pile up waiting for limited engineering resources.

Siloed Tools

The disconnect between idea tools (requirements), design tools (pixels), and development tools (code) that creates friction and rework across teams.

Redlines

The time-consuming process of comparing coded UI against original designs pixel by pixel. A major source of back-and-forth between designers and developers.

Design System Differences

Inconsistencies between how components appear in Figma and how they behave in code, causing rework and visual bugs.

Enterprise & Security

SOC 2 Type II Compliant

Builder.io meets rigorous third-party auditing standards for security, availability, and confidentiality of customer data.

Git-Managed Workflows

All code changes flow through Git with pull requests and branch management, giving developers full control and auditability over what ships.

Custom Roles and Permissions

Enterprise-grade access controls that let organizations define who can edit, publish, and approve across teams, brands, and locales.

Data Privacy

Builder.io never trains on customer data. Customers own all inputs and outputs generated through the platform.
